

The Society of Innovation

The goals and ideals of my utopia would have a heavy emphasis on innovation and individualism. People will have access to basic necessities as long as they contribute to society or are working on education. There will be equality in ethnicity, religion, age, gender, but if you want a mansion then you are going to need to work hard to acquire it. There will also be a transport focus of no cars, which will be explained more in depth later in the paper. Overall the focus would be on innovation and individualism.

In this utopia society basic necessities of life would be provided for those who can not afford to or are unable to provide for themselves, with the exception of healthcare which would be “free” regardless. There is a catch though since this stuff is not free. There will be taxes to help pay for it but for the most part those that need the government to supply food, water, housing, etc. will need to work or be going to school. If someone cannot find a job then the government would be happy to supply a job where your payment would be those basic necessities and some pocket cash.

Growth and innovation will be highly encouraged. Capital markets will be free and under control of private individuals. If the government finds that one of them is particularly interested and could be beneficial to the government or country or humanity as a whole then the government will offer to invest in the company, with both money and special tax cuts, in exchange for equity in said company. This should help boost the amount of innovation as well as get money to the government.

In the cities there will be parks, plazas, and a variety of paths for people to enjoy. There will also be murals, gardens, fountains, and special walls for people to spray paint. In the case of transportation there will be a focus on bikes and smaller electrical vehicles, such electric bikes, scooters, and skateboards. For long distance traveling the main vehicle used will be trains, electric based high speed bullet trains to be exact.

Laissez-Faire Capitalism did have a lot of innovation and was able to quickly produce goods but the workplace became a death trap. Workers are easily one of the most important parts of a business which is why my utopia will make sure that they are in safe and humane working conditions. While State-Based Communism does seem to have good intentions of perfect equality I do not like that you are stuck with what you need. To better explain this, in my utopia since you can own your business you can have a cruise ship to store your yachts in. I like a lot of what Liberal Welfare State Capitalism does but it just needs a few tweaks which is really what my utopia does, just with some extra focus on innovation. Social Market Economies do well in the business world but with monopolies there is no competition, and competition is one of the greatest ways to strive for innovation and success. The Nordic Model seems nice but it is basically the vacation home version of these systems. It is nice but when it comes down to it there are issues with sustainability. Anarcho-Capitalism and Anarcho-Communism both seem more of a bad thing to me since it relies on people acting human. So this is more of just my opinion but it seems like it would basically be the purge.
